FinCore API

Solution Book · v3.2.1 · Updated 2024-03-09

1. Overview

FinCore API is the primary financial operations interface for the Enterprise platform. It provides authenticated REST endpoints for account management, transaction processing, FX rate queries, and regulatory reporting.

The system processes an average of 2.4M requests per day with a p99 latency of 48ms. It integrates with 7 downstream services and feeds 3 regulatory reporting pipelines.

Key Architecture Decision (ADR-003)

Async processing adopted in v3.0 to handle regulatory batch windows. See ADR-003.

Architecture Notes

#architecture

#v3

#decisions

Overview

Key architectural decisions made during the v3 refactor of FinCore API. These notes capture the rationale behind major design choices for future reference.

Decision 1: Async Processing Adoption

Adopted asynchronous processing for all batch-type regulatory operations. Primary driver was the need to handle end-of-day regulatory windows without blocking synchronous API traffic.

See ADR-003 for the full decision record, including alternatives considered and rejection rationale.

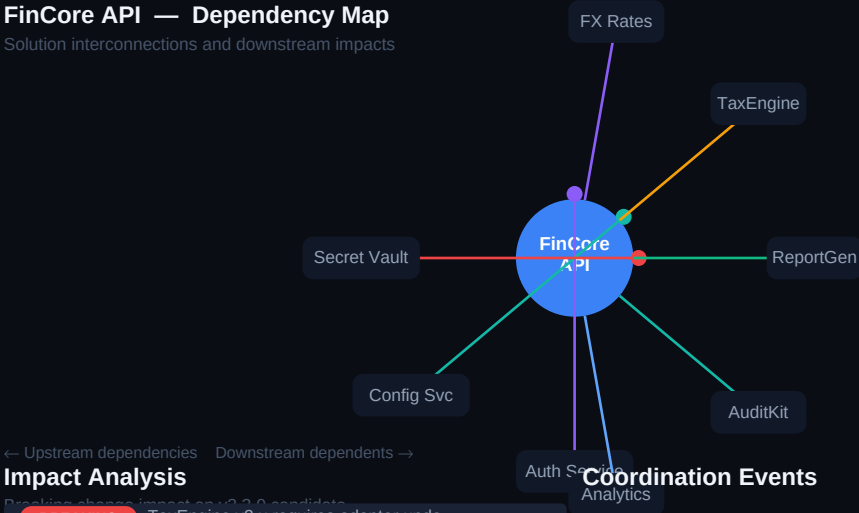

Decision 2: Rate Limiting Strategy

Implemented token bucket algorithm with configurable burst capacity per client. Soft limits enforced at API gateway; hard limits at core engine.
